

# DESCRIPTION OF COPPER

- Color:** Fresh surfaces have a pinkish-orange or reddish-brown look, which darkens over time when exposed to air.
- Conductivity:** It is an exceptional conductor of both heat and electricity, second only to silver.
- Workability:** It has high ductility and malleability, meaning it can be easily stretched into wires or hammered into thin sheets.
- Melting Point:** It melts at approximately 1,083°C (1,981°F).
- Corrosion Resistance:** It reacts slowly with air and moisture to form a protective green or blue-green patina layer

## **Electrical Systems**

Used extensively in wiring, cables, motors, and electronic circuits

## **Plumbing and Construction**

Used for water pipes, roofing materials, and hardware.

## **Alloys**

Mixed with other metals to create strong and versatile materials like brass and bronze

Prices have risen significantly over the past year due to tightening global supply
