

CARBON FIBER COMPOSITE

A lightweight material with remarkable strength

What is it?

Carbon fiber composite is a material made by embedding strong, thin carbon fibers in a resin matrix.

Carbon fibers → strength & stiffness

Resin → holds the fibers together and transfers loads

COMPOSITE STRUCTURE

Carbon fibers

embedded in resin

WHY IS IT SPECIAL?

Key properties and modern applications

LIGHTWEIGHT

High strength with low weight

STRONG & STIFF

Excellent mechanical performance

CORROSION RESISTANT

Does not rust like ordinary steel

WHERE IS IT USED?

Aircraft

Strong structures with reduced weight

Racing cars

Fast, lightweight body and components

Drones

Light frames for efficient flight

Medical

Used in selected medical devices and implants

Strong • Light • Useful
